```

Batch overview

- **2914** report files across **583** papers (4 runs x 1 papers, 5 runs x 582 papers)
- expected: **2925** report files across **585** papers (5 runs x 585 papers, from paperstore DB)
- missing: **11** across **3** papers
- n/a verdicts: **208** (7.1% of parsed) — paper triaged as not a standardization proposal, so the criteria were not applied
- score (x/14) over 2706 scored runs: min 0, max 14, mean 6.12, median 6, stdev 2.70

What the score is. Each run grades the paper on 7 criteria: why it matters, who is affected, prior art and alternatives, why the standard, coordination and interoperability, why a library will not do, and implementation experience. Every criterion is graded 0 (not addressed), 1 (asserted, with nothing supporting it) or 2 (supported with specifics) — a non-zero grade is only accepted if backed by a verbatim quote from the paper. Each criterion is graded independently on every chunk of the paper (3 samples per chunk) and its best grade counts. The score is the sum of the 7 grades, so 0–14. The verdict label is a fixed lookup on that sum: None = 0, Weak ≤ 3, Adequate ≤ 7, Strong ≤ 11, Excellent ≤ 14. "close to X" means the score sits exactly on a band edge, one point from the next label.

Per-paper scores across runs — gray = n/a or missing

Consistency aggregates

- all runs same verdict label: **377/583 (65%)** — of which 50 identical scores, 28 uniformly n/a
- label disagreement: **178/583 (31%)**
- split n/a vs a real verdict: **28**
- missing/unparseable runs: **0**

Score spread within papers

Max minus min of a paper's scores, over **551** papers with 2+ scored runs: mean **1.22**, median **1.0**, max **3**. Per-paper score stdev: mean **0.49**, max **1.25**.

Spread	Papers
0	62
1	323
2	149
3+	17

Verdict disagreement by paper

All 206 papers with label disagreement or an n/a split, most inconsistent first. This is the sortable, paginated dataframe; a plain-text version of the same table follows below.
